AquaPak

The AquaPak was developed specifically for **individual use** by the rural populations in developing countries who do not have access to potable water.

Using only solar energy, the AquaPak produces safe, potable water through the pasteurization process.

For maximum effectiveness when using the AquaPak outside of the Tropics of Capricorn and Cancer, please make sure to:

- fill only to **MINIMUM** water level line making sure the WAPI is completely covered with water until you have determined you have enough solar radiation to process a greater amount of water
- orange wax in the WAPI (Water Pasteurization Indicator) **MUST completely melt and turn clear** indicating that the 65 degree C temperature has been reached and the pasteurization process has been achieved.
